Assignment Questions 6

💡 **Question 1**

A permutation perm of n + 1 integers of all the integers in the range [0, n] can be represented as a string s of length n where:

s[i] == 'I' if perm[i] < perm[i + 1], and

s[i] == 'D' if perm[i] > perm[i + 1].

Given a string s, reconstruct the permutation perm and return it. If there are multiple valid permutations perm, return **any of them**.

Example 1:

Input: s = "IDID"

Output:

[0,4,1,3,2]

💡 Question 2

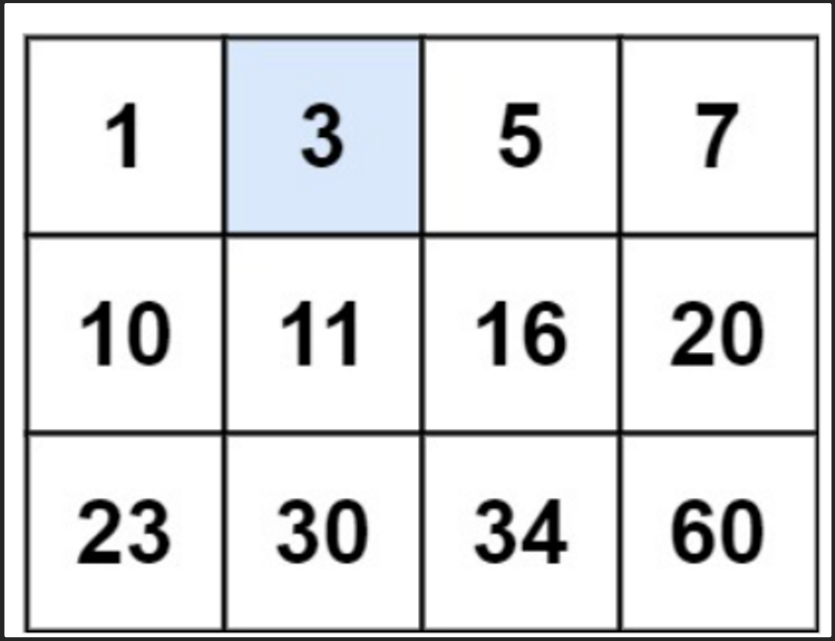
You are given an m x n integer matrix matrix with the following two properties:

- Each row is sorted in non-decreasing order.
- The first integer of each row is greater than the last integer of the previous row.

Given an integer target, return true *if* target *is in* matrix *or* false *otherwise*.

You must write a solution in O(log(m * n)) time complexity.

Example 1:



1	3	5	7
10	11	16	20
23	30	34	60

Input: matrix = [[1,3,5,7],[10,11,16,20],[23,30,34,60]], target = 3

Output: true

💡 Question 3

Given an array of integers arr, return *true if and only if it is a valid mountain array*.

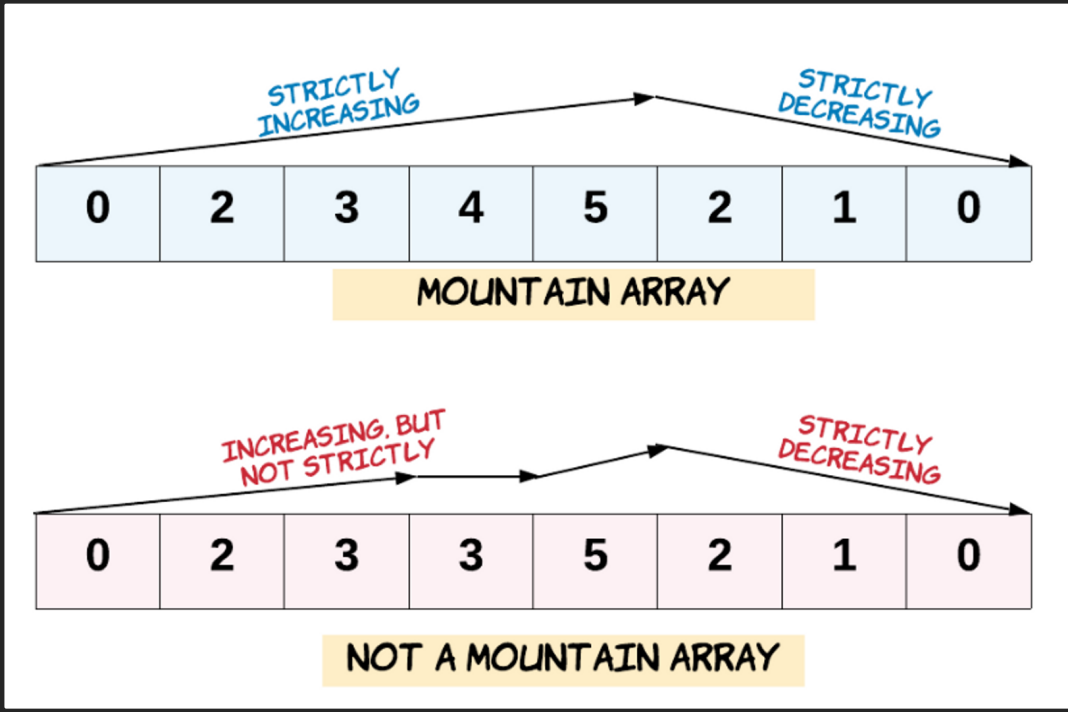
Recall that arr is a mountain array if and only if:

arr.length >= 3

There exists some i with 0 < i < arr.length - 1 such that:

arr[0] < arr[1] < ... < arr[i - 1] < arr[i]

arr[i] > arr[i + 1] > ... > arr[arr.length - 1]



Example 1:

Input: arr = [2,1]

Output:

false

💡 Question 4

Given a binary array nums, return *the maximum length of a contiguous subarray with an equal number of* 0 *and* 1.

Example 1:

Input: nums = [0,1]

Output: 2

Explanation:

[0, 1] is the longest contiguous subarray with an equal number of 0 and 1.

💡 Question 5

The **product sum** of two equal-length arrays a and b is equal to the sum of a[i] * b[i] for all 0 <= i < a.length (**0-indexed**).

> For example, if a = [1,2,3,4] and b = [5,2,3,1], the **product sum** would be 1*5 + 2*2 + 3*3 + 4*1 = 22.

Given two arrays nums1 and nums2 of length n, return *the* ***minimum product sum*** *if you are allowed to* ***rearrange*** *the* ***order*** *of the elements in* nums1.

Example 1:

Input: nums1 = [5,3,4,2], nums2 = [4,2,2,5]

Output: 40

Explanation:

We can rearrange nums1 to become [3,5,4,2]. The product sum of [3,5,4,2] and [4,2,2,5] is 3*4 + 5*2 + 4*2 + 2*5 = 40.

💡 Question 6

An integer array original is transformed into a **doubled** array changed by appending **twice the value** of every element in original, and then randomly **shuffling** the resulting array.

Given an array changed, return original *if* changed *is a* ***doubled*** *array. If* changed *is not a* ***doubled*** *array, return an empty array. The elements in* original *may be returned in* ***any*** *order*.

Example 1:

Input: changed = [1,3,4,2,6,8]

Output: [1,3,4]

Explanation: One possible original array could be [1,3,4]:

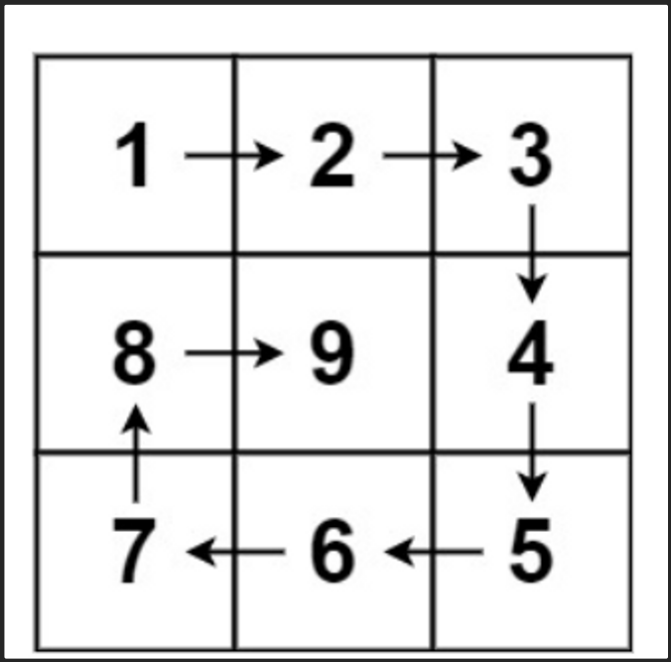
- Twice the value of 1 is 1 * 2 = 2.
- Twice the value of 3 is 3 * 2 = 6.
- Twice the value of 4 is 4 * 2 = 8.

Other original arrays could be [4,3,1] or [3,1,4].

💡 Question 7

Given a positive integer n, generate an n x n matrix filled with elements from 1 to n2 in spiral order.

Example 1:



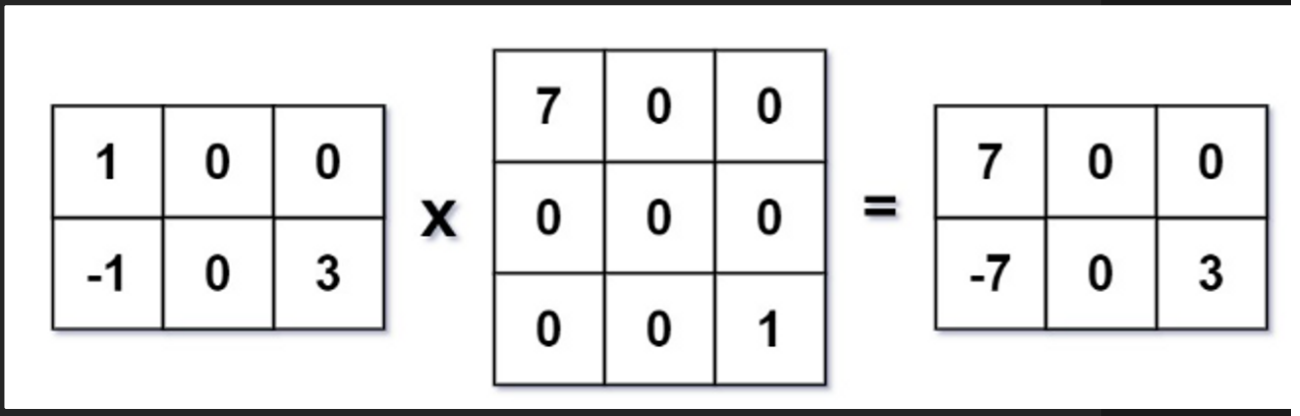
Input: n = 3

Output: [[1,2,3],[8,9,4],[7,6,5]]

Question 8

Given two sparse matrices mat1 of size m x k and mat2 of size k x n, return the result of mat1 x mat2. You may assume that multiplication is always possible.

Example 1:



Input: mat1 = [[1,0,0],[-1,0,3]], mat2 = [[7,0,0],[0,0,0],[0,0,1]]

Output:

[[7,0,0],[-7,0,3]]
